Request Information
Request Description
Patients should get a prepared questionnaire that asks them about their pain level.
Justification
This questionnaire is essential for tracking and assessing the pain levels of patients over time. It provides valuable insights into the effectiveness of the treatment plan and allows physiotherapists to make informed adjustments based on the patient's feedback. Also, it is important to show the benefits of the equipment used, if any.
Effect if declined (Risk if the project request is declined)
Without the ability to collect standardized feedback on pain levels, the company may lack essential data for optimizing and personalizing physiotherapy treatment plans. This could potentially limit the effectiveness of the app and its appeal to physiotherapists seeking data-driven solutions. And lack of this data can lead to loss of sponsors.
